Isfahan University of Technology (IUT) Department of Civil Engineering
RIVER ENGINEERING 1401-1402 Term II
Assignment #6 Scouring Due: 09/03/1402

---

1 A stream restoration project is planned for a sand bed channel that is currently straight and extremely wide due to historic channelization and straightening. The channel will be narrowed by 30 percent. Given the following data, determine the contraction scour depth for clear-water and Live-bed conditions and recommend the appropriate value.

$S = 0.0008$; $n = 0.034$; $d_{50} = 0.3$ mm ; $Q = 390$ m^3/s
$y_0 = 3.0$ m ; $W = 70$ m ; $V = 2.2$ m/s

2 During the design of a bridge, several complex pier configurations were tested in physical model studies. The purpose of this problem is to analyze local scour for the cylindrical pier configured as shown in the figure. It was determined that the water velocity would be 3.0 m/s for the Q_{100}. Determine the local scour using the superposition method and the effective diameter method. Use plane bed condition and $d_{50} = 0.7$ mm.
